<p><i>A few words about myself:</i></p>	<p>I have 5+ years of experience with server and client side JavaScript (NodeJS/AngularJS/Dojo Toolkit) and PHP (Zend Framework). A lot of database design and optimization experience (mainly on PostgreSQL and MySQL). I have experience in data source analysis and create data scraping software that is smart, failsafe and easy extendable with additional functionality. I took part in development of high loaded services, complex UI development of administrator's and user's dashboards. Additionally I have skill in development of desktop applications for Windows and *NIX based systems using C++.</p>
<p><i>Interests:</i></p>	IT & programming, heavy music, bicycle extreme riding, reading, 3D modeling

Other Experiences

Developing system for monitoring and automation of network equipment

The goal of software development was creating a system that should check the availability of the Internet channel and active network equipment. If there is no active connection software should initiate a reconnection or reset equipment. Development was carried out with the use of C ++ Builder, WinAPI, VCL

Domain Traffic Marketplace

A highly loaded domain traffic marketplace web service created to manage millions of requests every day. Main goal of this project is meeting advertisers with verified publishers which can show targeted ads for their web resources. This web service was developed on Node.JS with PostgreSQL as main data storage. Service was built on idea of mass parallel node workers balanced with help of Nginx. We are using several embedded interfaces for determine visitor's location, device characteristics and track each visitor for displaying varying of ads on his device. Another side of this project is dashboards for advertisers, publishers and administrators that was build on AngularJS.

MODx Revolution and MODx Evolution content management framework

I have experience with MODx (Revolution/Evolution) CMF. I did several news web sites and blogs for gamers community.

Optimal way searching system for taxi

I have developed a system that find optimal way for taxi drivers. I use Google Maps API for retrieve way through several points and exclude some of them if they are can be more optimal for another taxi driver. This system was written on pure PHP as extension for another big system.

Sequelize ORM / Migrations for Node.JS

Sequelize ORM is a part of my Node.JS backend workflow. Migrations were using while database developing, and they are provide clearly way to upgrade/downgrade existing db schema.
