

Hello Friends,

This is Himanshu Dixit, founder of Ergebins Technologies. Ergebins is a startup registered under Govt. of India with an objective to transform IT-business development through new and emerging Blockchain Technology. We have young IT professionals team with varied IT skills like Blockchain, JAVA, .NET, PHP, with database skills.

Let me brief you about myself and what triggered for me to start this venture. I am a blockchain consultant, certified business analyst, Scrum product owner and certified enterprise architect with 10 years of experience in the field of IT development and implementation from mid size to large scale IT projects. I have majorly worked in e-governance projects.

I have noticed during my experience a unique problem that mostly IT projects are using central system for processing and data digitisation projects involves storage of data in one central place.

while digitising from the manual process and generating different sets of data which is hoped to support in decision making and the basis of future projects for wellness and goodness of people. So this data needs to be sacrosanct and consistent with all stakeholders .

In order to solve this issue, we need to have a system where the data is captured as transaction and the transaction has workflow before saving. This will ensure consistency of data among all the stakeholders. I as a founder of Ergebins Technologies, would try to take a step from centralise development to decentralise application development
