Security Scan – CheckMarx (To fix the Vulnerability in Apex Xlass/Pages)

Project Details

Project Name   LadyBoss
Role   Developer
Skills   Email templates, Journey builder, and Synchronized data extension

Description   Basically marketing cloud used to send large scale of emails/SMS.
                          So here we have used for sending the emails to the customer who joined the campaign and also we send the survey emails to track the customer feedback for the card update feature

Project Name   Equote tool
Role   Team lead, Gather requirements, converting business scenario to technical. Delivering the final changes
Skills   Apex class, VF pages, lighting components

Description   We have implemented this for a telecom product based company.
                          Customer used to enter the products manually by typing the product name and quantity and the total price and they has to manage manually the rules/ extra products manually so this was taking lots of man hours to enter the data and generating the quote and sending it on the email.

                          So to overcome this issue we have implement a tool where customer can click a button to select the products and generating the quote and marketers can select the quotes and can send email as well.
                          Here the main advantage is time consumption. So we have created the rules in such a way that customer don't need to think which additional products to add.
                          For example: If customer added "ABC" product and its set up product will get automatically added.
