

AI Automation & Workflow Development

2+ years turning a lifelong passion for tech into smart AI automation solutions.

About Me

I've been passionate about technology since childhood — that curiosity eventually led me into the world of AI and automation, where I've spent the last 2 years helping businesses work smarter, not harder. Over that time, I've completed many projects building custom chatbots, automating repetitive workflows, and integrating AI tools like GPT and Claude into everyday business processes. Whether it's connecting apps with Zapier and Make, scraping and processing data, or designing a virtual assistant that actually understands your customers, I focus on solutions that are practical and built around how you actually work — not generic templates. I take the time to understand your specific pain points before building anything, and I stay engaged after delivery to make sure everything runs smoothly.

Services

- Custom AI chatbot & virtual assistant development
- Workflow automation (Zapier, Make, n8n)
- API integrations between business tools
- Data scraping & processing pipelines
- AI-powered document & data analysis

Hourly Rate	Minimum Budget
\$19.00 / hr	\$100.00

Featured Project

Automated Student Attendance & Parent Notification System (n8n)

Challenge:

A school needed a way to track student attendance, detect concerning patterns (like repeated absences), and keep both parents and headteachers informed — without relying on manual, error-prone tracking.

Solution:

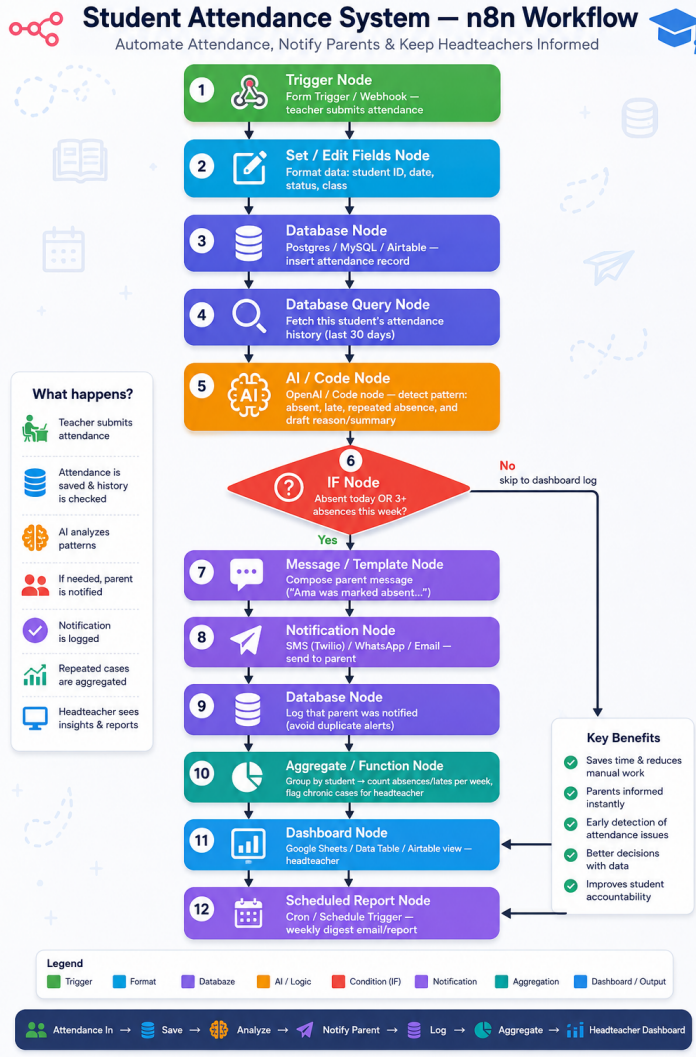

I designed a fully automated attendance workflow using n8n. When a teacher submits attendance through a form, the system automatically:

- Records and formats the data into a database
- Pulls the student's attendance history
- Uses AI to detect patterns (e.g., repeated absences) and draft a summary
- Automatically notifies parents via SMS/WhatsApp/Email if a student is absent or has 3+ absences in a week
- Logs notifications to avoid duplicate alerts
- Aggregates data into a dashboard for headteachers, plus a weekly scheduled report

Tools used: n8n, PostgreSQL/Airtable, OpenAI, Twilio/WhatsApp API, Google Sheets

Result:

The school eliminated manual attendance tracking, parents are notified instantly of issues, and headteachers get early visibility into attendance problems — improving accountability and response time.

Let's Automate Your Business

Struggling with repetitive manual tasks? I help businesses automate their workflows using AI and no-code/low-code tools so you can focus on growth instead of busywork.
